Reductionly distinct methyl-coenzyme M reductases in

Methanobacterium thermoautotrophicum strain Marburg and delta H.";

Bur. J. Bloochem. 194:871-87(1990)

-I- FUNCTION: Reduction of methyl-coenzyme M (2-(methylthio)

ethanesulfonic acid) with 7-mercaptoheptanoylthreonine phosphate

to methane and an hetezodisulfide.

-I- CATALYITC ACTIVITY: CH(3) -S-COM + H-S-HTP = CH(4) + COM-S-S-HTP.

-I- COFACTOR: THE BNZYME COMPLEX BINDS TIGHTLY (BUT NOT COVALENTLY)

TO TWO MOLECULES OF COENZYME F430. F430 IS A YELLOW NICKEL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                         BIOSYNTHESIS.

AAW39818-20 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 6A12, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic caid from 3H-phenyl occaine. The 6A12 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate monoceter transition state analogue. Antibody 6A12 has a per minute KCat of 0.072. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They concentration that can be achieved).

                                                                                                                                                                                                                                                                                   cross of the light chain of murine anti-CD23 (FCERII) monoclonal antibodies, such as chimeric or unanised antibodies, which comprise authodies, such as chimeric or humanised antibodies, which comprise sufficient of the amino acid sequences of Cl1 light and heavy chain corps (see AAY32254-59) to render them capable of binding to the CD23 type II molecule expressed on haematopoietic cells. The antibodies are used to block soluble CD3 formation for treatment of arthritis, cupus expressed on haematopoietic cells. The antibodies are used to block soluble CD3 formation for treatment of arthritis, diabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative collisis, Crohn's disease, Sjogren's syndrome, allergies, allergies, asthma, intrinaic asthma, acute asthmatic exacerbation, rhinitis, eccema, graft-versus-host disease, CODD, insulitis, bronchitis (particularly chronic bronchitis) or diabetes (particularly fornoic bronchitis) or diabetes (particularly fornoic bronchitis) or diabetes), and B-cell malignancies (Claimed). They are also useful for studying interactions between CD23 and various ligands and

identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 3B9 has a per minute Kcat of 0.11. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAW39824-26 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 12H1, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 12H1 antibody was identified using TSAs, and has a per minute Kcat of 0.16. The antibodies particularly for the treatment of an overdose. They are used for treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be

AAW39975-77 represent the sequences of the light chain complementarity determining regions (CDRs) of a catalytic antibody which is capable of degrading cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. These antibodies were found to have CDRs of the present sequence. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).
                                                                                                                                                                                                Light chain CDR1 of a catalytic antibody capable of degrading cocaine.
                                                                                                                                                                                                                         Variable domain, lambda light chain, catalytic antibody, degradation, cocaine, cocaine transition state analogue, TSA; benzoic acid, phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment; overdose; addiction.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAW39839-41 represent the sequences of the light chain complementarity determining regions (CDR8) of the catalytic antibody 8G4E, which is able to degrade cocaine. A series of cocaine transition state analogues (TSA8) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 8G4E antibody was identified using TSA3, and has a per minute Kcat of 0.12. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treatment of an overdose. They are also used for treatming addiction (by reducing the in vivo concentration that can be

AAW39921-23 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 2A10, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 2A10 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 2A10 has a per minute Kcat of 0.011. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                              New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1;

rhis invention describes novel antibodies (Ab) in which the variable region (VR) of at least one chain and/or the VR of at least one heavy chain includes at least one of 7 specified sequences, or fragments of these sequences, or contain at least one light chain and/or heavy chain encoded by specific nucleic acid sequences (I) and (II), reproduced, or their fragments. The products of the invention have antitumor and immunomodulatory activity. Ab, or other antibodies that recognize the same antigen, are used: (i) to identify cognate antigens, comparation, e.g. in an extracorporeal system; (iii) for generating additional antibodies able to label PC; and (iv) for treating autoimmune diseases and/or tumors, e.g. multiple myeloma, lymphoma and/or plastocytoma. Ab are specific for mature PC, i.e. they do not recognize plastocytoma. Ab are specific for mature PC, i.e. they do not recognize plastocytoma. Ab are specific for mature procursors are used as immunogens. Cherospeutic agents, they should show fewer side effects than conventional chemotherapeutic agents. This sequence represents the Wue-1 antibody
                                                         This sequence represents a peptide derived for the sequence of the light chain variable region complementarity determining region (CDR)-1 of the anti-hepatitis C Virus (HCV) Ser/Thr procease monoclonal antibody (MAb) 8D4 protein. The invention relates to the use of partial peptides (AAVI4348-Y14353) from the MAb 8D4 for inhibiting HCV serine protease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antibody; Wue-1; variable region; light chain; heavy chain; antitumor; immunomodulatory; cognate antigen identification; autoimmune disease; tumor; multiple myeloma; lymphoma; plastocytoma; CDR-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antibodies specific for plasma cells, useful for treatment and diagnosis of autoimmune diseases and plasma cell tumors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Murine derived antibody Wue-1 light chain variable region CDR-1.
                                                                                                                                                                                                                                                                                         Score 60; DB 20; Length 16

                                                                                                                                                                                                                                                                                                                                           The invention relates to transforming a population of cells (e.g. plant cells), comprising using a library of two different polynucleotides calls), comprising using a library of two different polynucleotides to encoding different immunoglobulin binding protein (IgBP) polypeptides that specifically bind to a ligand or form one or more disulphide bonds with polypeptides in transfected cells, to generate an IgBP that binds to a ligand, and transformed plant cells are selected, and at least 75% sequence identity to a framework region (RR) of a native IgM, IgG, IgA, IgD, IgE, IgY, kappa or lambda immunoglobulin molecule. The method is useful for preparing an immunoglobulin binding protein cells especially plant cells (e.g. Agrobacterium tumefaciens or maize) or other eukaryotic cells (e.g. insect cells or mammalian cells). The CHBP is useful for discovery of e.g. screening assays of IgBPs having desired characteristics. The present sequence is a mammalian immunoglobulin derived peptide that may be incorporated into an IgBP of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The inventors claim a chimeric monoclonal antibody which contains an anti-human fibrin antibody light chain variable region contg. at least one of the polypeptide chains A, B and C (AAR24705, AAR24706) and a human antibody light chain constant region. The chimeric Abs can be used both in vivo and in vitro and, since they have very low immunogenicity as compared with mouse Abs, they can be administered to humans for diagnostic and therapeutic purposes. They are also more stable and show a longer half-life in the blood as compared with the original mouse Abs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates a humanised antibody that specifically binds an epitope contained within positions 13-28 of amyloid beta peptide, beta. The antibody is useful to inhibit and reduce the formation of amyloid plaques or the effects of coluble Abeta species in humans their fragments are used for the manufacture of a medicant. This includes the prolonged expression of recombinant sequences of them in human tissues for the treatment of clinical/pre-clinical Alzheimer's disease, Down's syndrome or pre clinical cerebral amyloid angiopathy. Specifically, the antibody is used to sequester Abeta into plasma, brain or cerebrospinal fluid to prevent/reverse accumulation of the Abeta peptide within the brain thereby improving cognition. The present sequence is human light chain CDR1 (complementarity determining region 1) used to humanise the mouse monoclonal antibody 266 to produce Hu266.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mouse; graft rejection; CC chemokine receptor 2 antagonist; CCR2 antagonist; anti-CCR2 antibody; kidney transplant; liver transplant; lung transplant; pancreas transplant; bowel transplant; heart-transplant; graft versus host disease; chronic graft rejection; antibody light chain; mAb 1D9; CDR1; complementarity determining region 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mouse mAb 1D9 antibody light chain complementarity determining region 1.

Patent No. 548658

GENERAL INFORMATION:

APPLICANT: Landry Donald, W.

TITLE OF INVENTION: ANTI-COCAINE CATALYTIC ANTIBODY

NUMBER OF SEQUENCES: 108

CORRESPONDENCE ADDRESS:

ADDRESSE: Cooper and Dunham LLP

STREET: 1185 Avenue of the Americas

CITY: New York

STATE: New York

T-cell receptor beta chain V-D-J region (161-2A) - mouse (fragment)
C;Species: Mus musculus (house mouse)
C;Species: Mus musculus (house mouse)
C;Accession: PT0700
C;Accession: PT0700
R;Reeney, A.J.
J. Exp. Med. 174, 115-124, 1991
A;Theference number: PT0509; MUID:91277601; PMID:1711558
A;Accession: PT0700
A;Reference number: PT0509; MUID:91277601; PMID:1711558
A;Accession: PT0700
A;Reture: translation not shown
A;Mesidues: 1-5 cPEE>
A;Experimental source: newborn thymus, strain BALB/C
C;Reywords: T-cell receptor

-!- FUNCTION: Inhibits spontaneous contractions in several muscle groups. May be involved in the expansion phase of feeding behaviour in sea anemones.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Neuron-specific.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
